# **AP Physics 1 Summer Assignment**

#### 1. Scientific Notation:

The following are ordinary physics problems. Write the answer in scientific notation and simplify the units ( $\pi$ =3).

a. 
$$T_s = 2\pi \sqrt{\frac{4.5 \times 10^{-2} kg}{2.0 \times 10^3 kg/s^2}} =$$

$$T_S$$
=\_\_\_\_\_

b. 
$$F = \left(9.0 \times 10^9 \frac{N \cdot m^2}{C^2}\right) \frac{\left(3.2 \times 10^{-9} C\right) \left(9.6 \times 10^{-9} C\right)}{\left(0.32 m\right)^2}$$

c. 
$$\frac{1}{R_p} = \frac{1}{4.5 \times 10^2 \Omega} + \frac{1}{9.4 \times 10^2 \Omega}$$

$$R_p = \underline{\hspace{1cm}}$$

d. 
$$K_{max} = (6.63 \times 10^{-34} J \cdot s)(7.09 \times 10^{14} s) - 2.17 \times 10^{-19} J$$

$$K_{max}$$
=\_\_\_\_\_

e. 
$$\gamma = \sqrt{1 - \frac{2.25 \times 10^8 \, m/s}{3.00 \times 10^8 \, m/s}}$$

f. 
$$K = \frac{1}{2} (6.6 \times 10^2 \text{ kg}) (2.11 \times 10^4 \text{ m/s})^2 =$$

g. 
$$(1.33)\sin 25.0^{\circ} = (1.50)\sin \theta$$

$$\theta$$
=

1

# 2. Solving Equations:

Often problems on the AP exam are done with variables only. Solve for the variable indicated. Don't let the different letters confuse you. Manipulate them algebraically as though they were numbers.

a. 
$$K = \frac{1}{2}kx^2$$

b. 
$$T_p = 2\pi \sqrt{\frac{\ell}{g}}$$

c. 
$$F_g = G \frac{m_1 m_2}{r^2}$$

c. 
$$F_g = G \frac{m_1 m_2}{r^2}$$
 ,  $r =$ \_\_\_\_\_\_

d. 
$$mgh = \frac{1}{2}mv^2$$

d. 
$$mgh = \frac{1}{2}mv^2$$
 ,  $v =$ \_\_\_\_\_\_

e. 
$$x = x_o + v_o t + \frac{1}{2} a t^2$$
 ,  $t =$ \_\_\_\_\_\_

f. 
$$B = \frac{\mu_o}{2\pi} \frac{I}{r}$$

f. 
$$B = \frac{\mu_o}{2\pi} \frac{I}{r}$$
 ,  $r =$ 

g. 
$$x_m = \frac{m\lambda L}{d}$$

g. 
$$x_m = \frac{m\lambda L}{d}$$
 ,  $d =$ 

h. 
$$pV = nRT$$

h. 
$$pV = nRT$$
 ,  $T =$ 

i. 
$$\sin \theta_c = \frac{n_1}{n_2}$$

i. 
$$\sin \theta_c = \frac{n_1}{n_2}$$
 ,  $\theta_c =$  \_\_\_\_\_

j. 
$$qV = \frac{1}{2}mv^2$$

j. 
$$qV = \frac{1}{2}mv^2$$
 ,  $v =$  \_\_\_\_\_

#### 3. Conversion

Science uses the *KMS* system (*SI*: System Internationale). *KMS* stands for kilogram, meter, second. These are the units of choice of physics. The equations in physics depend on unit agreement. So you must convert to *KMS* in most problems to arrive at the correct answer.

kilometers (km) to meters (m) and meters to kilometers centimeters (cm) to meters (m) and meters to centimeters millimeters (mm) to meters (m) and meters to millimeters nanometers (nm) to meters (m) and meters to nanometers micrometers  $(\mu m)$  to meters (m)

gram (g) to kilogram (kg)Celsius  $({}^{o}C)$  to Kelvin (K)atmospheres (atm) to Pascals (Pa)liters (L) to cubic meters  $(m^{3})$ 

Other conversions will be taught as they become necessary.

What if you don't know the conversion factors? Colleges want students who can find their own information (so do employers). Hint: Try a good dictionary and look under "measure" or "measurement". Or the Internet? Enjoy.

a. 
$$4008 g = ____ kg$$

c. 
$$823 \, nm = ___ m$$

d. 
$$298 K = {}^{\circ}C$$

e. 
$$0.77 m = cm$$

f. 
$$8.8 \times 10^{-8} m = ____m mm$$

j. 
$$8.23 m = \underline{\qquad} km$$

k. 
$$40.0 cm = ____m$$

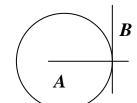

1. 
$$6.23 \times 10^{-7} m = nm$$

m. 
$$1.5 \times 10^{11} m = _____ km$$

## 4. Geometry

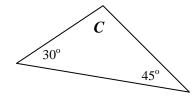

Solve the following geometric problems.

- a. Line **B** touches the circle at a single point. Line **A** extends through the center of the circle.
  - i. What is line **B** in reference to the circle?

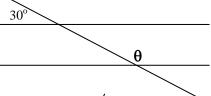

ii. How large is the angle between lines A and B?

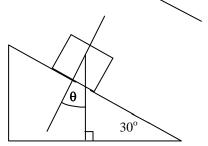

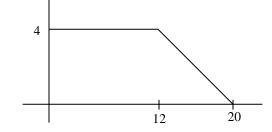

c. What is angle  $\theta$ ?

d. How large is  $\theta$ ?

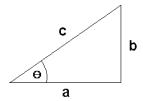

- e. The radius of a circle is 5.5 cm,
  - i. What is the circumference in <u>meters</u>?
  - ii. What is its area in square meters?
- f. What is the area under the curve at the right?

# 5. Trigonometry

Using the generic triangle to the right, Right Triangle Trigonometry and Pythagorean Theorem solve the following. *Your calculator must be in degree mode.* 

g.  $\theta = 55^{\circ}$  and c = 32 m, solve for a and b.

\_\_\_\_\_

h.  $\theta = 45^{\circ}$  and a = 15 m/s, solve for **b** and **c**.

\_\_\_\_\_

i.  $\boldsymbol{b} = 17.8 \, m$  and  $\boldsymbol{\theta} = 65^{\circ}$ , solve for  $\boldsymbol{a}$  and  $\boldsymbol{c}$ .

\_\_\_\_\_

j. a = 250 m and b = 180 m, solve for  $\theta$  and c.

\_\_\_\_\_

k. a = 25 cm and c = 32 cm, solve for b and  $\theta$ .

\_\_\_\_\_

1.  $\boldsymbol{b} = 104 \ cm$  and  $\boldsymbol{c} = 65 \ cm$ , solve for  $\boldsymbol{a}$  and  $\boldsymbol{\theta}$ .

### **Vectors**

Most of the quantities in physics are vectors. *This makes proficiency in vectors extremely important*.

Magnitude: Size or extend. The numerical value.

**Direction**: Alignment or orientation of any position with respect to any other position.

Scalars: A physical quantity described by a single number and units. A quantity described by <u>magnitude only</u>.

Examples: time, mass, and temperature

Vector: A physical quantity with **both a magnitude and a direction**. A directional quantity.

Examples: velocity, acceleration, force

Notation:  $\overrightarrow{A}$  or  $\overrightarrow{A}$ 

<u>Length</u> of the arrow is <u>proportional to the vectors magnitude</u>. <u>Direction</u> the arrow points is the direction of the vector.

## **Negative Vectors**

Negative vectors have the same magnitude as their positive counterpart. They are just pointing in the opposite direction.

#### **Vector Addition and subtraction**

Think of it as vector addition only. The result of adding vectors is called the <u>result</u>ant.  $\overrightarrow{R}$ 

$$\overrightarrow{A} + \overrightarrow{B} = \overrightarrow{R}$$
  $\overrightarrow{A}$   $+$   $\overrightarrow{B}$   $=$   $\overrightarrow{R}$ 

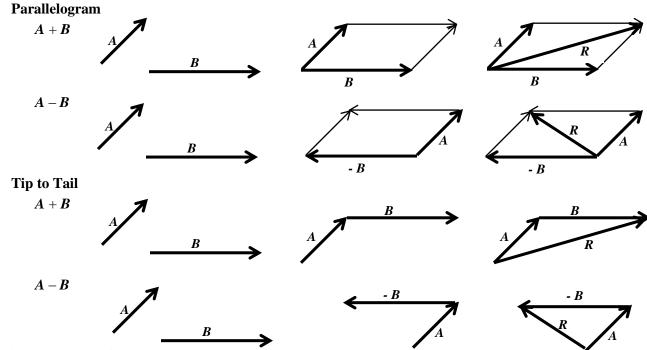

So if A has a magnitude of 3 and B has a magnitude of 2, then R has a magnitude of 3+2=5.

When you need to subtract one vector from another think of the one being subtracted as being a negative vector. Then add them.

A negative vector has the same length as its positive counterpart, but its direction is reversed. So if A has a magnitude of 3 and B has a magnitude of 2, then R has a magnitude of 3+(-2)=1.

<u>This is very important</u>. In physics a negative number does not always mean a smaller number. Mathematically -2 is smaller than +2, but in physics these numbers have the same magnitude (size), they just point in different directions ( $180^{\circ}$  apart).

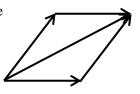

There are two methods of adding vectors

#### 6. Drawing Resultant Vectors

Draw the resultant vector using the parallelogram method of vector addition.

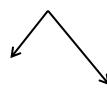

Example

b.

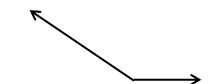

d.

a.

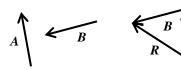

e.

Draw the resultant vector using the tip to tail method of vector addition. Label the resultant as vector  $\mathbf{R}$ 

Example 1: A + B

f. X + Y

h.  $\boldsymbol{P} + \boldsymbol{V}$ 

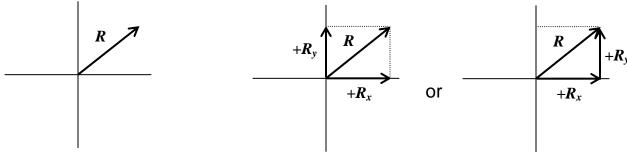

i. *C-D* 

# **Component Vectors**

A resultant vector is a vector resulting from the sum of two or more other vectors. Mathematically the resultant has the same magnitude and direction as the total of the vectors that compose the resultant. Could a vector be described by two or more other vectors? Would they have the same total result?

This is the reverse of finding the resultant. You are given the resultant and must find the component vectors on the coordinate axis that describe the resultant.

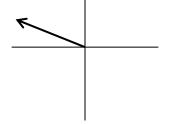

Any vector can be described by an x axis vector and a y axis vector which summed together mean the exact same thing. The advantage is you can then use plus and minus signs for direction instead of the angle.

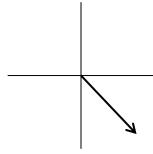

#### 7. Resolving a vector into its components

For the following vectors draw the component vectors along the x and y axis.

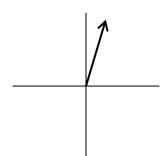

a.

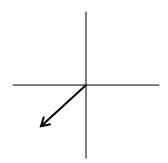

c.

b.

d.

Obviously the quadrant that a vector is in determines the sign of the x and y component vectors.
